

Architecture Diagrams

CoExist Alert

Code with Cisco | Silver Flag CSR Challenge | Mission 3: Human-Animal Coexistence

Architecture Read

These diagrams show the four views reviewers need most: system components, detection-to-warning sequence, escalation and ownership workflow, and runtime deployment. The same architecture is implemented in the app and summarized in the Markdown companion document.

Reading note

The diagram pages are intentionally landscape so the PDF remains as readable as the GitHub-rendered Markdown diagrams. Field sensors and demo signals are simulated in this proof of concept; alerting, audit logging, exports, live updates, and responder ownership are implemented in the app.

1 System Components

What this view proves

The field layer is simulated, but every signal enters through the same ingest API that production field devices would call. The server owns confirmation, health, cascade, response, live updates, analytics, and export.

2 Detection To Warning Sequence

False-positive path

A weak single signal remains unconfirmed, is logged quietly, and expires without channel dispatch if no second source corroborates it inside the confirmation window.

3 Escalation And Ownership Workflow

Ownership rule

Unconfirmed signals promote only after high confidence or second-source corroboration; otherwise they expire without public alerting. The first acknowledging responder owns the incident. A paged senior can take over, but other responders cannot progress or resolve someone else's active incident.

4 Runtime And Deployment Flow

Deployment proof

The public deployment is verified by matching the latest Git commit with `/api/version`, plus `/api/health` for database, simulator, and Webex readiness.

5 Cisco Mapping Summary

Stage	Cisco product	Role in CoExist Alert
Sense	Meraki MV, MT, Cisco Spaces	Production edge detection and sensor payload shape.
Observe	ThousandEyes, Splunk	Health semantics, reliability analytics, event-log export.
Engage	Webex APIs	Live guard alert card and optional in-card acknowledgement.
Connect	Meraki MG, Catalyst	Remote backhaul narrative and link-quality model.
Secure	Duo, Secure Access, Umbrella	App auth/RBAC now; Duo step-up when configured; production access-control path.
